

Waveterm D – Security & Compatibility Notes

Waveterm D is independently developed software and is currently not digitally code-signed.

Because of this, Windows SmartScreen or Microsoft Defender may display a warning when starting the application for the first time after download.

This is expected behavior for new or unsigned applications downloaded from the internet.

To start Waveterm D on Windows:

1. Click More info
2. Click Run anyway

The application does not install system components and can be removed by simply deleting the program folder.

If you downloaded Waveterm D from the official homepage or official GitHub release page, the file is authentic and has not been modified.

macOS

Depending on your macOS security settings, Gatekeeper may prevent the application from opening on first launch.

If this happens:

1. Open System Settings → Privacy & Security
2. Scroll to the security message
3. Click Open Anyway

After confirmation, the application can be started normally.

Tested with

Windows

- Desktop PC
- Windows 11

macOS

- MacBook Air
- 2560×1600 Retina Display
- macOS Tahoe Version 26.4.1

Known Issues

Version 1.525

Windows 11

- No known issues

macOS

- No Waveterm D icon displayed while running Waveterm D
- First connect Behringer Wave – then start Waveterm D

Linux

- Waveterm D should run on Linux, but is currently untested

Notes

- Waveterm D is a standalone application
- No installer is used
- No background services are installed
- A direct USB connection to the Behringer Wave is recommended
